1. Claims 26-34 are presented for examination.
2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.
3. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
4. Claims 26-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Beshai et al.
5. Beshai et al (6,721,271) taught the invention substantially as claimed including packet streamer into an existing network interconnector to control data traffic, the apparatus comprising:

- a) an ingress gateway configured to control entry of data packets into a network (col 2, line 20 et seq, and col 8, line 35 et seq);
- b) a content traffic exchange hop or traffic control mechanism (figure 5) attached to at least one of a legacy switching component and a routing network component (col 3, line 13 et seq; col 3, line 63 et seq; col 4, line 1 et seq; and col 10, line 25 et seq);
- c) an egress gateway configured to control the exit of data packets from the network and to stream content to end users (col 4, line 30 et seq; and col 10, line 29 et seq).

6. It would have been obvious to one of ordinary skill in the networking art at the time of the invention that the claimed invention differed from the teachings of Beshai et al only by a degree, e.g., in the claimed object particulars versus the packet processing particulars of Beshai et al teachings. But this is no more than a difference in a degree because this depends on system architecture and if Beshai et al system were applied to object processing, it would perform object processing as claimed because applicant's claimed invention takes after the three stage system, i.e., ingress-core-switch-egress architecture. Other claimed features of the dependent claims are all obvious variations of the well known features of ingress-egress packet or object processing systems including traffic management (scheduling) particulars (see for example, col 14, line 8 et seq).
